## FOUR IN A ROW GAME BOARD D (DOUBLES)

### K-2nd Grade Mathematics

How to play:

1. Player A places a game marker on one number (in the list at the bottom) and doubles the number, doubles the number and adds 1, or doubles the number and subtracts 1. Then Player A shades that value on the game board. If the value shows up more than once on the game board, the player only gets to shade one of them.
2. Player B moves the game marker to a new number and follows the same steps as Player A in Step 1.
3. Players continue playing. The first player to get four shaded sums in a row wins.
